

Newhard Farms Corn Shed

Inventory Website User Manual

Everything the website does, in plain language — written so anyone can run the stand from it.

Start here: the weekly routine the short version — what to do and when

If something looks wrong the first page to turn to

The top bar on every screen

1. Inventory counts, alerts, what needs ordering

2. Esh Order build and send the weekly order

3. Order arrivals check in a delivery

4. Clover Queue changes waiting to reach Clover

5. Esh checklist printable unboxing sheet

6. Modifier items items with flavors, like Zerbes

7. Offset zone items to keep a cushion of

8. Box sizes case sizes and order multiples

9. Wednesday discard weekly toss list

10. Order list any non-Esh order

11. Trends and Seasonal what sells, and when

12. Sync check and Restore points safety net

How the order amount is worked out the arithmetic, spelled out

Start here: the weekly routine

If you read only one page, read this one. Everything else is detail.

Once a week — Sunday: place the Esh order

1. Open the **Esh Order** tab.
2. Press **Generate Esh order**. Every Esh item appears; the ones that need restocking already have a suggested amount, the rest sit at 0.
3. Look down the list and change anything you disagree with. The **last order** column shows what was ordered the previous week, which is the quickest sanity check.
4. For Zerbes (and anything else with flavors), set the boxes per flavor in the section at the top.
5. Press **Place split order**. Two things happen: the spreadsheet to send to Esh downloads, and each delivery day becomes a pending order on the Order arrivals page.
6. Send that spreadsheet to Esh.

Tip: The order already accounts for the days before the truck arrives. Ordering Sunday for a Wednesday delivery buys enough to cover Monday and Tuesday as well.

Twice a week — Wednesday and Friday: check in the delivery

1. Open **Order arrivals** and find the pending order for that day.
2. Press **Confirm with Esh PDF** and upload the invoice PDF that came with the delivery. It fills in what actually arrived and flags anything short or backordered. (Or press **Confirm manually** and type the amounts.)
3. Check the numbers, then confirm. The counts go up and sync to Clover on their own — you should see a short **Delivery synced to Clover** message.
4. That is the whole job. There is nothing to download and nothing to upload into Clover.

The order changed after you placed it?

That is normal — say you find you need more shoofly pies on Monday. On the pending order press **Edit order** and change the amount, add an item, or remove one. Then the arrival will match what actually shows up.

Every day — nothing required

There is no daily task. Sales come in from the register automatically, so the counts keep themselves current. Glancing at the **Inventory** tab to see what is low is useful but optional.

Wednesday: the toss list

Items on the **Wednesday discard** list are set to zero automatically some time on Wednesday and that gets sent to Clover. You do not have to do anything. If you want it done at a particular moment, open the page and press **Discard now**.

If something looks wrong

Common situations and exactly what to do. Most of these are not problems.

A count in the website does not match the shelf

Just type the right number into the **In stock** box on the Inventory tab. It saves and goes to Clover by itself. You do not need permission from anything and you cannot break it — a count is only a number.

A count looks wrong in Clover

Open **Order arrivals** and press **Sync all to Clover**. That pushes everything the website knows to Clover in one go. It is safe to press as often as you like — it sends exact counts, so pressing twice does the same thing as pressing once.

Stock is negative

Clover allows negative counts, so this means more was sold than the count knew about. Count the shelf and type the real number in. If it keeps happening on the same item, mention it to Evan.

The delivery came but the invoice PDF will not read

Use **Confirm manually** instead and type the amounts. Nothing is lost by doing it that way; the PDF is only a shortcut.

Something did not sync and you are not sure

The banner at the top of **Order arrivals** always tells you the truth. If it says everything is in sync, it is. If it says changes are waiting, press **Sync all to Clover**.

The website looks empty when you open it

Do not re-enter anything and do not upload anything. Close it and open it again — it will reload the data. The website refuses to overwrite good data with nothing, so the information is still there. If it is still empty after two tries, phone Evan.

You think you broke something badly

Go to **Sync check** and scroll to the bottom for **Restore points**. A restore point is saved automatically every time you sync from Clover, so you can roll the whole site back to how it looked earlier. It asks you to type RESTORE to confirm, and it saves a copy of the current state first, so a restore can itself be undone.

Two things that are NOT problems

1. Stock going down through the day. That is the register. It is supposed to. **2. The order suggesting 0 for lots of items.** Every Esh item is listed every week, whether it needs ordering or not. A 0 means it does not need any, and it leaves the box blank on the sheet Esh receives.

The top bar

Controls that sit at the top of every screen.

The Clover button

This shows the live connection to the register. When it is connected it reads **Clover** with a tick and pulses gently while it is syncing. Tap it for detail, to pause syncing, or to run a full **Sync from Clover** by hand. A full sync also saves a restore point.

The buttons

Download Clover file	A spreadsheet of your counts to import into Clover by hand. You should not need this — the live connection does it automatically. It exists as a backup if Clover is ever unreachable.
Upload export	Load counts in from a Clover spreadsheet export. Also a backup route, not part of normal use.
Download backup	Saves a file with all the website's data to the device. Harmless and worth doing occasionally.
Help	Opens help, including a link to this manual.
moon / sun	Switches between automatic, light and dark appearance.

Also on every screen

- **The tabs** across the top switch pages. On a phone the tabs scroll sideways and **More** stays pinned on the right; tapping it opens a list of the rest of the pages.
- **Sticky notes** — every page has its own note area for reminders. Tap to write one.
- **Everything saves by itself**, to the cloud, and two people can use the site at the same time on different phones.
- **The website runs on farm time** (Eastern), even if the phone using it is in another time zone. So Wednesday means Wednesday here.

Putting it on a phone's home screen

1. Open the website in **Safari** on the iPhone (it has to be Safari for this).
2. Tap the Share button (the square with an arrow pointing up).
3. Scroll down and tap **Add to Home Screen**, then **Add**.
4. It now opens full screen from the corn icon, like an app. Updates arrive on their own.

1. Inventory

Everything you sell and how much is on hand. This is the home screen.

Top of the page

- **Count tiles:** total items, actively tracked, out of stock, low stock, well stocked.
- **Sales summary:** units sold, biggest movers, and a bar chart of units sold per day for the last two weeks. That chart comes from real register sales, so a delivery never distorts it.

What each column means

Order	A checkbox that drops the item onto the Order list for reordering.
Item	Name, category tag, price and Esh item number. Tap the name to open a detail window with a two-week stock graph, how many sold, and quick controls.
Sold since last	How many sold since the last sync.
In stock	The count. Type over it to correct it; it saves and syncs by itself.
Add	Log a small one-off delivery of just this item.
Alert at	The low-stock level. It works itself out from how fast the item sells (shown as AUTO), or type your own number.
Status	In stock, Low, Out or Skipped, plus a skip box for things you grow yourself.
Suggested reorder	How much to order, with a small tag showing how many days that covers. Hover or tap the tag to see the breakdown.

Finding things

All items	Filter tabs: All items, Out, Low, In stock, Needs reorder, Tracked, Not tracked.
All categories	Narrow to one category.
Search...	Type part of a name or an Esh item number.

Tip: Correcting a count here is the normal, expected way to fix a wrong number. Do it freely.

2. Esh Order

Build the weekly Esh Foods order and split it across delivery days.

The three parts of the page

- **Flavor items at the top** — Zerbes and anything else with flavors. Each flavor has its own stepper, its own Esh item number, and shows what is on hand.
- **How it splits across delivery days** — a preview of what lands Wednesday and what lands Friday.
- **The whole order** — every Esh item, grouped by category. This is where you edit amounts.

The buttons

Generate Esh order	Fills the order. Every item with an Esh item number is listed: ones that need restocking get a suggested amount, everything else sits at 0.
Place split order	Downloads the spreadsheet for Esh and creates a pending order per delivery day on Order arrivals.
Delivery split settings	Set which days Esh delivers and how each category divides between them.
Add an Esh item...	Search and add anything by hand.
Clear	Empties the order.

What you will see on the rows

last order 2 cases	What was ordered on the previous Esh order — 0 if it was not on it.
OUT - 1+ box Wed	You are out, so at least one box is pulled onto the earliest delivery day to get it back fast.
+1 box offset	This item is in the Offset zone, so a cushion is included.
8d	How many days this order has to last: the days until it arrives plus the days until the next delivery.

Splitting one item differently

Open a category in **The whole order** and you can set a custom percentage split for a single item. There is a **Keep this split for future orders** box: leave it ticked and the split sticks, untick it and the split applies to this order only and then clears itself.

The spreadsheet that gets sent to Esh

- It is ordered the same way as this page: grouped by category, alphabetical inside each group.
- Items at 0 are left blank rather than showing a zero.
- Items ordered in groups (like half-gallon drinks that come in 3s) are written as a **total number of units** with the unit **each** — so 60 units reads as 60, not 12 groups.
- A brand new item that is not in Esh's usual list is inserted in its correct alphabetical spot, not tacked on the end.
- The date at the bottom updates to the day the order was created.

3. Order arrivals

Check in a delivery. This is the most important page day to day.

There is no download step and nothing to load into Clover.

The banner at the top

This is the honest answer to the question "is everything in Clover?". It either says everything is in sync, or it says how many changes are waiting and offers a **Sync all to Clover** button. Pressing that button is always safe, including twice.

A pending order

Confirm with Esh PDF	Upload the invoice PDF. It reads on the device, matches each line by Esh item number, fills in what arrived, and flags short or backordered lines.
Confirm manually	Tick items off and type the amounts.
Edit order	Change amounts, add an item or drop one — for when the order changed after you placed it. Nothing is saved until you press Save changes, and an edited order is badged as edited.

A received order

Open	Undo the delivery, or copy it to the Order list to reorder.
Remove	Takes it out of the history.

What happens to the counts

Confirming a delivery raises the counts straight away and sends them to Clover immediately, whether the stand is open or closed. The website turns on stock tracking in Clover for any item that needs it, and quietly retries anything that does not go through the first time. You get one short confirmation and no list of problems to chase.

4. Clover Queue

Changes that are waiting to reach Clover. Usually empty.

A count change made while the stand is open can be held here for a moment so it does not collide with a live sale. Items here apply to Clover on their own. The tab shows a number when anything is waiting.

- Each row shows the item, the change, and the count it is heading for.
- If something cannot be written, the reason is shown on the row.
- You can apply everything now, or clear a single row.

Tip: If this page is empty, there is nothing to do — that is the normal state. Deliveries do not wait here; they go straight to Clover.

5. Esh checklist

A printable sheet for whoever is unloading the truck.

Upload Esh invoice PDF	The same invoice PDF used on Order arrivals.
Download printable PDF	Builds the checklist to print.
New invoice	Start again with a different invoice.

- Items are grouped into your categories, exactly as Esh sent them.
- Every line has a tick box, the quantity, the name, the **price**, and the Esh item number.
- Backordered items are listed separately so nobody hunts for them.

Tip: This page never changes any counts. It is purely for printing. Use Order arrivals to update stock.

6. Modifier items

Items that are one product on the register but several flavors to order — Zerbes.

On the register, Zerbes is a single item and the flavor is chosen as an option, because all four flavors share one barcode. The website keeps the flavors apart underneath so each can be counted and ordered on its own.

Each flavor row

Flavor	The flavor name.
Esh item #	That flavor's own Esh item number. This is what deliveries match on and what goes on the order sheet.
On hand	That flavor's own count. Type over it to correct it.
Units/case	Units per case for this flavor. Leave blank to use the parent's.
Alert at	Low-stock level for this flavor. Blank shares out the parent's.
Suggested	How much of this flavor to order.

The tick box that matters

Track each flavor as its own item turns the flavor counts on. When you switch it on, the parent's current count is **split across the flavors so the total does not change** — the register sees no difference at that moment. Then correct each flavor by hand.

What the register sees

Always one number. The flavors are added together and that single total is what goes to Clover under the one item, so the barcode and the register keep working exactly as before. The flavors themselves are never sent as separate items.

How the flavor counts keep themselves up to date

- A delivery of one flavor raises **that flavor**, and the total goes up with it.
- Sales come off the flavors. If the register recorded which flavor was chosen, it is exact; if it only recorded the item, the sales are shared out across the flavors by how much of each is on hand.
- Because the shared-out version is an estimate, correct any flavor by typing the real number in. The total always stays right either way.

Tip: Tap Zerbes on the Inventory tab to see the flavor breakdown without coming to this page.

7. Offset zone

Items you never want to run low on.

Set an offset for an item and choose **units** or **boxes**. The offset does two things: it raises the low-stock alert, and it is added on top of the normal order so the count at the leanest point of the week sits at the offset instead of near zero.

Worked example. An item that normally flags low at 10, with a case of 12, given a 1-box offset: it now flags at 22, and the order is built so about 12 are still on the shelf the day before the next delivery.

- Set the amount to 0 to take an item out of the zone.
- Ordering strength still follows how fast the item really sells; the offset only sets the floor.
- Offset items show a small note on the Esh order.

8. Box sizes

How each item is packed and how Esh will sell it.

12 units / case

How many units are in one case. This is how boxes convert to units when a delivery arrives.

3 smallest order

The smallest number of units Esh will sell. Half-gallon drinks that only come in 3s get a 3 here, so orders are always a whole number of 3s.

Setting the smallest order below the case size is what the website calls a grouped item. Those are the ones written to the Esh sheet as a total number of units with the unit **each**.

9. Wednesday discard

Perishables that get thrown out every week.

Add the items that get tossed. They stay on the list **permanently** — the list is a standing list, not a one-off. Only the X button takes something off it.

- Once Wednesday arrives (farm time), the listed items are set to zero automatically and that is sent to Clover. No action needed.
- **Discard now** does it immediately if you would rather not wait.
- On the Esh order, discard items are ordered as though they will be at zero, so enough is reordered.

Tip: If you added items and they seem to have vanished, they will come back on their own now — the list reattaches items by name. Tell Evan if it happens again.

10. Order list

For any order that is not the weekly Esh order.

- Low items appear on their own; add anything else by hand.
- Untick an item to hold it back without losing it. The X removes it.
- **Mark as ordered** sends the ticked items to Order arrivals as a pending order.

Tip: For the weekly Esh order use the Esh Order page instead — it splits across delivery days and produces the sheet Esh needs.

11. Trends and Seasonal

What sells, and when.

Trends

Fastest and slowest movers over a window you choose, from real register sales.

Seasonal

A month-by-month picture of each item, which nudges order amounts up before a busy stretch and down after it. **It now builds itself** from register sales as they come in — there is nothing to upload.

- **Import history from Clover** pulls in past sales in one go, so the pattern is useful sooner.
- You can still upload Clover Item Sales spreadsheets; an uploaded month wins over the automatic one.
- The seasonal nudge uses **previous years**, so sales collected this year mainly help next year.

12. Sync check and Restore points

The safety net.

Sync check

- **Product code on the wrong item** — an Esh number sitting on an empty item while a look-alike holds the real stock. This is the classic reason a delivery lands on the wrong item. Fix it in Clover by moving the code onto the item you actually sell.
- **Oversold, drift and spikes** — numbers that do not add up, listed so you can look.

Restore points

At the bottom of the page. One is saved automatically every time you sync from Clover. Restoring puts the whole site back to how it looked at that moment — counts, orders, settings. It asks you to type RESTORE, and it saves a copy of the current state first, so a restore can be undone.

Product codes come from Clover

The website mirrors Clover's **Product Code** field exactly and never uses the SKU field. Add a code in Clover and it appears here; clear it in Clover and it clears here, and the item drops off the Esh order. If an Esh number needs to change, change it in Clover.

How the order amount is worked out

For when you want to know why it suggested what it suggested.

In one line

Order enough to reach a target, then round up to how Esh sells it.

The target

- **How fast it sells** — units sold in the last three weeks divided by the number of days it was actually in stock. Days when it was sold out do not count against it, so being out does not make the website think an item stopped selling.
- **Blended with the season** — the same month in previous years, weighted by how much history exists.
- **Times a holiday bump** if a big day falls in the window.
- **Times the number of days to cover** — the days until the delivery actually arrives, plus the days until the delivery after that. Ordering Sunday for a Wednesday and Friday delivery covers 8 days.
- **At least the alert level**, whichever is higher.
- **Plus the offset**, if the item is in the Offset zone.

Then

- Subtract what is on hand.
- Round up to a whole number of whatever Esh sells (a case, or a group of 3, or single units).
- Never less than one of those, if it needs any at all.

Tip: The small day tag on each suggestion (like 8d) tells you how many days that order is meant to last.

If in doubt. Correcting a count is always safe. Pressing Sync all to Clover is always safe. Neither can lose data. When something looks properly wrong, the Restore points at the bottom of Sync check can put everything back.
