3. Esh Order
4. Modifier Items
5. Box sizes
6. Order arrivals
7. Esh checklist
8. Trends
9. Seasonal
10. Sync check
11. Wednesday discard

How to read this manual

A quick key to the buttons and colors pictured throughout.

Button styles

	Green (solid): the main action on a page — the thing that gets the job done.
	Outlined: a helper action, like auto-filling or opening settings.
	Plain text: a minor or “undo” action, such as clearing or cancelling.
	Red: a destructive action that changes or deletes a lot — used carefully.
	Filter tab (off): click to filter the list; grey when not selected.
	Filter tab (on): the active filter, shown in green.

Color meanings (stock, bars, tags)

	Red means out of stock, a problem, or something that did not arrive.
	Amber/yellow means low stock or “needs attention soon.”
	Green means well stocked or in sync.

Tip: Wherever you see a colored pill like these in this manual, that is a picture of what the button or label actually looks like in the website.

The top bar

Controls at the top of every screen, no matter which page you are on.

The Clover sync indicator

This colored pill shows whether the website and Clover currently match. Tap it any time for details or the next step. It moves through five states:

	Red. The store is open, so sales are changing Clover live. Nothing can be perfectly in sync until it closes.
	Blue. You downloaded a Clover import file waiting to go into Clover. After uploading it into Clover, tap this and confirm to turn it green.
	Yellow. The website has changes Clover doesn't know about yet — a delivery, an edit, or a discard.
	Orange. You were in sync, but the store has been open since, so Clover has newer sales. Upload a fresh export.
	Green. The website matches Clover. It stays green until something changes.

Tip: If you've connected directly to Clover (see the next section), the site keeps itself in sync automatically and you rarely touch the export/upload buttons — they stay as a backup.

The buttons

	Pull Clover's latest numbers in from a spreadsheet — export your Items list from Clover and upload it here. (Not needed once you're connected directly to Clover.)
	Builds a spreadsheet with your latest counts to import back into Clover (use the one on the newest received order, marked ★).
	Opens the Clover connection window — connect directly to Clover so syncing happens automatically. Covered in the next section.
	Theme toggle — cycles automatic → light → dark appearance.
	Opens the help window, which links to this manual.

Also on every screen

- **Navigation tabs** — the row of page names; tap one to switch pages.
- **Sticky notes** — each page has its own note area for reminders.
- **Passcode lock** — if on, you enter a code to open the site.
- **Download backup** — at the very bottom of the page (in the footer): saves a complete backup file of all your data to your device. Handy to grab once in a while.
- **Auto-save & sharing** — everything saves to the cloud, and two people can use it at once.

Connecting to Clover

Link the website straight to Clover so it syncs on its own — no more exporting and importing spreadsheets.

Why connect?

Without a connection, keeping Clover and the website matched means exporting a file from Clover and uploading it, then downloading a file here and importing it back — the step where mistakes happen. Connecting directly to Clover does all of that automatically, in the background. The spreadsheet method still works anytime as a backup.

The Connect button and window

Connect

In the top bar. Opens the connection window. The label changes to show status: **Connect** (not connected), **Clover ✓** (connected), or **Clover ■** (paused).

Connect

Inside the window: after you pick Test store or Real store and paste your Merchant ID and API token, this links it up.

What it does once connected

↓ Sync from Clover

Pulls Clover's live items, stock, prices, and categories into the website right now. (This only reads Clover — it never changes anything there.)

↑ Push counts to Clover

Writes your current counts back into Clover right now.

Automatic sync

A checkbox (on by default). When on, the site pulls Clover's latest about every minute, and pushes your changes back a few seconds after you make them.

Pause syncing

Temporarily stops all syncing but keeps you connected.

Disconnect

Removes the connection entirely. Your data stays; you just go back to the spreadsheet method.

How automatic sync keeps things safe

Pulling (sales coming in) happens all day. Pushing your changes up is held until the store closes so it can never land on top of a live sale.

- **You'll always see current counts** — sales flow in all day, about once a minute.
- **Your changes show on the site immediately**, but only get sent up to Clover after closing (to avoid clashing with live sales). Use **Push counts to Clover** if you ever want to send them up right now.
- **On login, you'll see a "what changed in Clover" report** — new items, price changes, and removed items — the same report you used to get from an upload.

Sales history

Import last 3 months

In the Connect window. Pulls your past Clover sales in so Trends and Seasonal have real history to work with. Also buttons for 6 and 12 months.

Recent sales come in automatically going forward. The import buttons are a one-time “catch up on the past” — run one when you want to backfill history.

*Tip: The token needs an extra permission for sales history: when you make the token in Clover, include **Orders: Read** along with Inventory read and write. Without it, the sales import can't read your orders.*

1. Inventory

The master list of everything you sell and how much you have. This is the home screen.

Top of the page

- **Five count tiles:** Total items, Actively tracked, Out of stock (red), Low stock (amber), Well stocked (green).
- **Sales summary:** units sold, biggest mover, items that just hit low, items now out — as bars and colored pills.

The item table — what each column is

1	2	3	4	5	6	7	8
chk	Item / tag / price / #	Sold	Stock	+Add	Alert	Status	Reorder

Anatomy of one item row (numbers match the list below).

1 Order	A checkbox — check it to drop this item onto the Order list for reordering.
2 Item	Name, colored category tag, price (click to edit), and Esh item number (#).
3 Sold since last	How many sold since your previous Clover upload.
4 In stock	The current count in an editable box, with a colored bar underneath. Type to change it.
5 ■ Add	Log a quick delivery of just this item — boxes, units per box, loose units.
6 Alert at	The low-stock alert level. Shows AUTO, or click to set your own number.
7 Status	A badge (In stock / Low / Out / Skipped) plus a “skip” checkbox to ignore an item.
8 Suggested reorder	How much to reorder, e.g. “Order 6 boxes,” with a ■ tag if boosted for a big day.

Finding and organizing

All items	Filter tabs: All items, Out, Low, In stock, Needs reorder, Not tracked.
All categories ■	Category dropdown — narrow to one category.
Search...	Type part of a name or an Esh item number to jump to an item.
Item ↑	Click a column heading (Item, Sold since last, In stock, Alert at) to sort by it.
Skip all visible	Skip or un-skip every item currently shown at once.
Export table to CSV	Downloads the current table as a spreadsheet.
Reset all inventory to zero	Sets every count to zero — rarely needed, use with care.

Step by step — update a count

1. Find the item with search or a filter.
2. Click the “In stock” box and type the new number.
3. Click away; it saves for everyone automatically.

Step by step — log a quick one-off delivery

1. Click “■ Add” on the item’s row.
2. Enter boxes received, units per box, and any loose units.
3. Confirm — the count goes up by that total.

Example: 2 extra boxes of jam (12 per box) plus 3 loose jars → $2 \times 12 + 3 = 27$ added.

Tip: For a whole Esh delivery, use Order arrivals instead of adding items one at a time here.

2. Order list

A general worksheet for building any order and sending it to Order arrivals.

Items below their alert level appear here automatically; you can also add anything by hand. When you place the order, it becomes a pending arrival you can check off later.

Every button

Order name...	Name this order (optional), e.g. "Jar goods."
Add an item...	Search your inventory and click a result to add it.
All categories ▀	Filter the list to one category.
■ Generate list	Auto-fills with everything currently low or out.
■ Reorder like last week	Copies items and box counts from your most recent placed order.
Mark as ordered	Sends checked items to Order arrivals; unchecked items stay for next time.
Clear list	Empties the list.

On each row

- A **checkbox** to hold an item back without deleting it (category headers have one too).
- A **quantity box** for how many to order.
- A **X button** to remove the item entirely.

Step by step — place an order

1. Click "■ Generate list," or add items by hand.
2. Adjust quantities; uncheck anything you're skipping.
3. Click "Mark as ordered."

Tip: For the weekly Esh order, use the Esh Order page — it splits across delivery days automatically.

3. Esh Order

Build your weekly wholesale order for Esh Foods — the website turns it into a spreadsheet you send to Esh.

First, what is this and why do we do it?

Esh Foods is our main wholesale supplier. Every week we buy products from them — baked goods, chips, jarred goods, milk, meats, and so on — to restock the shelves. To place that order, Esh needs a list of what we want and how much, written with their item numbers, in a specific spreadsheet format.

Writing that list by hand every week is slow and easy to get wrong. **This page does it for you.** It looks at what you're low on, works out how much to buy, lets you adjust anything, and then builds the exact spreadsheet Esh expects — which downloads to your computer so you can send it to Esh Foods. It also remembers the order so you can check the delivery off when it shows up (on the Order arrivals page).

The big picture — from empty page to a delivery on the shelf

You only touch the first three steps on this page. The spreadsheet it makes is the hand-off to Esh.

Why it splits across delivery days

Esh delivers more than once a week (for us, Wednesday and Friday). Instead of everything arriving in one giant drop, the website can split the order so some boxes come Wednesday and some come Friday — keeping the shelves stocked through the week. You set how that split works once, in Delivery split settings, and it applies every time.

Step 1 — put items on the order

You have three ways to fill the order; most weeks you'll just use the first:

■ Generate Esh order	The easy button. The website scans your inventory and auto-fills the order with every Esh item that's running low or out, with a suggested box count for each. Start here.
<i>Add an Esh item...</i>	Type to search and add any item by hand — for something you want that isn't low yet. (Only items that have an Esh item number can be ordered.)
Import from spreadsheet	Load an existing Esh order spreadsheet, if you already have one built.

Step 2 — modifier items (flavored items like Zerbes)

Some items are sold as one product in Clover but ordered from Esh as separate flavors — Zerbes chips are the example. Those show at the very top of the page so you can choose how many boxes of each flavor to buy:

recommends 9	A guide showing the total number of boxes suggested for the whole item (all flavors combined).
---------------------	--

– 2 +

A stepper for each flavor — tap –/■ or type a number of boxes. Whatever you set is added to the order automatically. (See page 4 for how modifier items are set up.)

Step 3 — review and fine-tune

Below the buttons are two sections that update live as you edit:

- **“How it splits across delivery days”** — a preview showing exactly what arrives Wednesday vs. Friday.
- **“The whole order”** — the full list. Change any box count, remove an item with X, or open a category to fine-tune how that category splits between days.

You may also see these flags on a row — the website adds them automatically:

OUT · 1+ box Wed

You're completely out of this item, so at least one box is pulled to the earliest delivery day to get it back on the shelf fast. The rest still follows your normal split.

■ discards Wed

This item is on the Wednesday discard list (it gets tossed weekly), so it's ordered as if you'll be starting from zero.

Step 4 — place the order and send it

Place split order

The finish button. It (1) downloads the Esh order spreadsheet to your computer, and (2) creates a “pending arrival” for each delivery day on the Order arrivals page so you can check the delivery off later.

Clear

Empties the current order and starts over.

Step by step — a full weekly order, start to finish

1. Click “■ Generate Esh order.” The list fills with what you need.
2. At the top, set how many boxes of each Zerbes flavor you want.
3. Look over “How it splits across delivery days” and adjust any category split if you like.
4. In “The whole order,” fix any box counts, and add or remove items.
5. Click “Place split order.” A spreadsheet downloads to your computer.
6. Send that spreadsheet to Esh Foods (the same way you always send orders — email or upload).
7. When the delivery arrives, go to Order arrivals and check it off (see page 6).

Tip: Nothing is sent to Esh automatically — the website only makes the spreadsheet. You still send it to Esh yourself, so you're always in control of what goes out.

4. Modifier Items

For items sold as ONE item in Clover but ordered from Esh as separate flavors — e.g. Zerbes.

How it works

- In Clover, Zerbes is one product with flavor modifiers; its stock is the source of truth and never changes here.
- Here you list the flavors, each with its own Esh number and an optional planning count.
- You order the flavors individually on the Esh Order page.
- When flavors are delivered, the boxes received add into the single Zerbes stock count.

Every control

Add a parent item...	Search and pick the item (e.g. Zerbes) to make it a modifier item.
Flavor name	The flavor's name (read from Clover, editable).
Esh item #	The Esh number for that flavor — what deliveries match on.
Count	Optional planning number; does not change Clover stock.
■ Add flavor	Add another flavor row.
×	Remove a flavor.
Remove	Turns it back into a normal item (flavor list deleted; Clover stock untouched).

Step by step — set up Zerbes

1. Search “Zerbes” and add it as a modifier item.
2. Confirm the flavor names.
3. Type each flavor's Esh item number.
4. Done — flavors now appear on the Esh Order page.

Tip: The flavor counts here are only for planning. Clover's single number is always the real stock.

5. Box sizes

Tell the website how each item is packed and how Esh lets you order it.

The two settings on every row

12 units / box

Units per box: units in one case. Lets the site convert boxes to units on delivery.

3 multiples of

Order in multiples of: for items Esh sells only in fixed groups. Suggestions round to the nearest multiple. Leave at 1 for normal items.

How “multiples of” rounds

- Need 5, multiples of 3 → orders **6**.
- Need 4, multiples of 3 → orders **3**.
- Need 1, multiples of 3 → orders **3** (can't order less than one group).

Example: Half-gallon milk must be ordered in 3's — set it to 3 and the site never suggests an amount Esh won't sell.

Step by step

1. Find the item.
2. Set “units / box” to the case size.
3. If Esh sells it only in groups, set “order in multiples of.”
4. It saves automatically.

6. Order arrivals

Confirm deliveries, update your stock, and push the new counts to Clover.

The lifecycle of an order

The full path from placing an order to syncing it back to Clover.

Buttons on a PENDING order (yellow)

Confirm with Esh PDF	Upload the invoice PDF; the site reads it, matches each line by Esh number, fills in cases arrived, and flags anything short, missing, or backordered.
Confirm manually	Check items off and type amounts by hand.
Remove	Deletes the pending order without receiving it.

Buttons on a RECEIVED order (green)

↓ Download Clover file	On the newest order (★), builds the file to upload into Clover.
Open	Undo the order, or copy it back to your Order list to reorder.
Remove	Removes it from the history.

Right after you confirm, the site quietly double-checks every received item actually updated — in the app and the cloud. It stays silent if all is well, and only pops up if something didn't update, naming the exact items.

Step by step — check off a delivery with the PDF

1. On the pending order, click "Confirm with Esh PDF."
2. Upload the invoice PDF and wait (a minute or two for a long one).
3. Review the quantities and warnings, then click "Mark as received."
4. On the newest received order (★), click "↓ Download Clover file."
5. Upload that file into Clover, then tap the blue sync pill and confirm.

Tip: If you're connected directly to Clover, steps 4–5 happen on their own — the new counts push up automatically (after the store closes). You'd only download the file by hand if you're not connected.

7. Esh checklist

A clean, printable checklist for the crew unboxing the delivery.

Every control

■ Upload Esh invoice PDF

Upload the same invoice PDF you use on Order arrivals.

■ New invoice

Start over with a different invoice.

■ Download printable PDF

Generates the categorized checklist to print for the crew.

What the sheet shows

- Items regrouped into **your Clover categories**, shown exactly as Esh sent them (no comparison to what you ordered).
- A **checkbox** beside every item, with its quantity, name, and Esh number.
- A red “**Backordered — did not arrive**” section so the crew knows what not to look for.

Step by step

1. Open Esh checklist and click “Upload Esh invoice PDF.”
2. Wait for it to read and group the items.
3. Click “Download printable PDF.”
4. Print it and hand it to the crew.

Tip: This page never changes stock — it's purely for reading and printing. Use Order arrivals to update counts.

8. Trends

See what is selling well and what is moving slowly.

Controls

Last 14 days ■

Choose the window: last 7, 14, 30, or 60 days.

All categories ■

Narrow to one category.

What it shows

- Your fastest and slowest movers, based on your Clover upload history.
- A weekly sales summary to compare periods.

The more Clover exports you upload over time, the sharper these trends get. Use it to spot what to stock more of and what's tying up shelf space.

9. Seasonal

Teach the website your seasonal patterns so reorder suggestions adjust by time of year.

Controls

Upload monthly sales

Upload a Clover Item Sales report for a month; the site learns each item's monthly pattern.

■ Add a big day

Mark a special date (like the Fourth of July) so orders bump up ahead of it.

Clear all history

Erases the seasonal data you've uploaded.

What you'll see

- A **month grid** per item, shaded by how much it sells, with ■ / ■ flags for strong and weak seasons.
- Suggested reorder amounts that rise automatically as a busy season approaches.

Step by step

1. In Clover, export an Item Sales report for a month.
2. Upload it here.
3. Repeat for other months — the pattern sharpens each time.
4. Add big days so the site pre-stocks you before the rush.

10. Sync check

Catches data problems between Clover and the website before they cause bad counts.

What it flags

wrong item

Product code on the wrong item — an Esh number is on an empty Clover item while a look-alike item holds the real stock. The classic reason a delivery updates the wrong item. Fix it in Clover by moving the code to the item you actually sell.

needs review

Oversold, stock drift, sales spikes — numbers that changed in ways that don't add up, so you can double-check.

Restore points

At the very bottom is a small “**Restore points**” link. A restore point is saved automatically every time you upload a Clover export; you can roll the whole site back to one of those moments if something goes wrong.

Restore points

Opens the list of saved points.

Restore

Rolls back to that point — asks you to type RESTORE to confirm, and saves a safety copy of the current state first.

Tip: Restoring replaces everything — counts, orders, settings. It's intentionally hard to reach so it can't happen by accident.

11. Wednesday discard

Manages perishable items that get thrown out each Wednesday.

How the discard works

Because the toss applies to the next export you upload, an out-of-date export can never cancel it out.

Every control

Add a perishable item...	Search and add items tossed each week (baked goods, etc.).
x	Removes an item from the discard list.
Discard all now	Zeroes every listed item immediately instead of waiting for the next export.
Discard queued	An amber banner shown once Wednesday arrives, reminding you the toss applies on your next upload.

Step by step

1. Search and add each perishable item.
2. Leave it — after Wednesday, the amber “queued” banner appears.
3. Upload your Clover export as usual; the items zero automatically after import.
4. Or click “Discard all now” to do it immediately.

Tip: On the Esh Order page, discard-list items are ordered as if they'll be at zero, so you reorder enough.
